

COMP 4320 Introduction to Computer Networks
Homework Assignment 1 Liam Maher
Due on Sunday, June 30 on Canvas (upload your answer sheet)

Instruction: Every student should finish the following questions independently. Give justification for the results (e.g., show the time-domain diagram and/or calculation process) to receive credits. Scan your answer sheet and upload it to Canvas.

In the following, for simplicity of your calculation, let K denote 1000, and M denote 1 million.

1. Calculate the total time (defined as the interval from the moment that the handshaking starts to the moment that the last bit of the file is received by the destination) required to transfer a 1000-KB file in the following cases, assuming an RTT of 50 ms, a packet size of 1 KB data, and an initial $2 \times \text{RTT}$ of “handshaking” before data is sent:

(a) The bandwidth is 1.5 Mbps, and data packets can be sent continuously.

Soln:

RTT = 50 ms

Make Bandwidth KBps $\rightarrow 1.5 \text{ Mbps} = 1.5 * 1000 / 8 \text{ KBps} = 1500 / 8 = 187.5 \text{ KBps}$

Calc $T_t = \text{File size} / \text{bandwidth} = 1\text{KB} / 187.5\text{KBps} = 5.3333 \text{ ms}$

$T_p = \text{RTT} / 2 = 50 / 2 = 25 \text{ ms}$

of packets = $1 * 1000 = 1000$

$$\begin{aligned} D &= 2 * \text{RTT} + 1000 * T_t + T_p \\ &= 2 * 50\text{ms} + 1000 * 5.3333 + 25 \\ &= 100 + 5333.3 + 25 \\ &= 5458.3 \text{ ms} \\ &= 5.4583 \text{ s} \end{aligned}$$

(b) The bandwidth is 1.5 Mbps, but after we finish sending each data packet we must wait one RTT before sending the next.

Soln:

RTT = 50 ms

Make Bandwidth KBps $\rightarrow 1.5 \text{ Mbps} = 1.5 * 1000 / 8 \text{ KBps} = 1500 / 8 = 187.5 \text{ KBps}$

Calc $T_t = \text{File size} / \text{bandwidth} = 1\text{KB} / 187.5\text{KBps} = 5.3333 \text{ ms}$

$T_p = \text{RTT} / 2 = 50 / 2 = 25\text{ms}$

of packets = $1 * 1000 = 1000$

$$\begin{aligned} D &= 2 * \text{RTT} + 999(T_t + \text{RTT}) + T_t + T_p \\ &= 2 * 50 + 999(5.3333 + 50) + 5.3333 + 25 \\ &= 100 + 999(55.3333) + 5.3333 + 25 \\ &= 100 + 55278 + 5.3333 + 25 \\ &= 55408.3333 \text{ ms} \\ &= 55.40833 \text{ s} \end{aligned}$$

(c) The bandwidth is “infinite,” meaning that we take transmit time to be zero, and up to 20 packets can be sent per RTT.

Soln:

$$RTT = 50 \text{ ms}$$

$$T_t = 0 \text{ ms}$$

$$T_p = RTT/2 = 50 / 2 = 25$$

$$\# \text{ of packets} = 1000 * 1 = 1000$$

So 50 batches

$$D = 2 * RTT + 50 * RTT + T_p$$

$$= 2 * 50 + 50 * 50 + 25$$

$$= 100 + 2500 + 25$$

$$= 2625 \text{ ms}$$

$$= 2.625 \text{ s}$$

- (d) The bandwidth is infinite, and during the first RTT we can send one packet (2^{1-1}), during the second RTT we can send two packets (2^{2-1}), during the third we can send four (2^{3-1}), and so on. (hint: the sum of the geometric series is given by: $1+2+\dots+2^{n-1} = 2^n - 1$)

Soln:

$$RTT = 50 \text{ ms}$$

$$T_t = 0 \text{ ms}$$

$$T_p = RTT/2 = 50 / 2 = 25$$

$$\# \text{ of packets} = 1000 * 1 = 1000$$

Need smallest n such that $2^n - 1 \geq 1000$

$$2^{10} - 1 = 1023 \text{ so we need 10 batches}$$

$$D = 2 * RTT + (10-1) * RTT + T_p$$

$$= 2 * 50 + 9 * 50 + 25$$

$$= 100 + 450 + 25$$

$$= 575 \text{ ms}$$

$$= .575 \text{ s}$$

2. Consider a point-to-point link 50 km in length. At what bandwidth would propagation delay (at a speed of $2 \times 10^8 \text{ m/s}$) equal transmit delay for 100-byte packets? What about 512-byte packets?

Soln for 100 byte packet:

$$\text{Distance} = 50 \text{ km} * 1000 = 50,000 \text{ m}$$

$$\text{Speed of medium: } 2 \times 10^8 \text{ m/s}$$

$$T_p = \text{Distance} / \text{speed of medium} = 50,000 \text{ m} / 2 \times 10^8 = 0.00025 \text{ s} = .25 \text{ ms}$$

Packet size

We need where $T_t = T_p$

$$T_t = \text{file size} / \text{bandwidth}$$

So we need to find bandwidth

$$100\text{byte} * 8 = 800 \text{ bits}$$

$$800 / \text{bandwidth} = 0.25 \text{ ms}$$

$$0.00025\text{s} = 800 / \text{bandwidth}$$

$$\text{Bandwidth}(\text{bps}) = 800 \text{ bits} / .00025 \text{ s}$$

$$\text{Bandwidth} = 3200000 \text{ bps}$$

$$= 3.2 \text{ Mbps}$$

Soln for 512 byte packet:

$$\text{Distance} = 50 \text{ km} * 1000 = 50,000 \text{ m}$$

$$\text{Speed of medium: } 2 \times 10^8 \text{ m/s}$$

$$T_p = \text{Distance} / \text{speed of medium} = 50,000 \text{ m} / 2 \times 10^8 = 0.00025 \text{ s} = .25 \text{ ms}$$

Packet size

We need where $T_t = T_p$

$$T_t = \text{file size} / \text{bandwidth}$$

So we need to find bandwidth

$$512\text{byte} * 8 = 4096 \text{ bits}$$

$$4096\text{bits} / \text{bandwidth} = 0.25 \text{ ms}$$

$$.00025\text{s} = 4096 / \text{bandwidth}$$

$$\text{Bandwidth}(\text{bps}) = 4096 \text{ bits} / .00025\text{s}$$

$$\text{Bandwidth} = 1638400 \text{ bps}$$

$$= 16.384 \text{ Mbps}$$

3. Suppose a 1-Gbps point-to-point link is being set up between the Earth and a new lunar colony. The distance from the moon to the Earth is approximately 385,000 km, and data travels over the link at the speed of light— 3×10^8 m/s.

- (a) Calculate the minimum RTT for the link.

Soln:

$$\text{RTT} = 2 * \text{Propagation delay}$$

$$T_p = \text{Distance} / \text{speed of medium}$$

$$= 385,000 * 1000 \text{ (to convert to meters)} / 3 \times 10^8$$

$$= 385,000,000 / 3 \times 10^8$$

$$= 1.283333 \text{ s}$$

$$\text{RTT} = 2 * T_p$$

$$= 2 * 1.283333$$

$$= 2.5667 \text{ seconds}$$

- (b) Using the RTT as the delay, calculate the delay \times bandwidth product for the link.

Soln:

$$\text{Bandwidth} = 1 \text{ Gbps} = 1,000,000,000 \text{ bps}$$

$$\text{Delay} = \text{RTT} = 2.5667 \text{ seconds}$$

$$\text{Delay} * \text{Bandwidth} = 2.5667 \text{ seconds} * 1,000,000,000 \text{ bps}$$

$$(\text{seconds cancel}) = 2566700000 \text{ bits}$$

$$= 2566.7 \text{ Mb}$$

$$= 2.5667 \text{ Gbits}$$

(c) What is the significance of the delay \times bandwidth product computed in (b)?

Soln: When multiplying the delay \times bandwidth, the seconds cancel out leaving us with, in this case, 2.5667 Gbits. This number is significant as it is the maximum amount of data that can be in transit on the network at a given time. For example, in the treadmill/conveyor belt example used in the class lectures, the maximum amount of data that could be on that conveyor belt at a given time is 2.5667 Gbits of data between the earth and new lunar colony.

(d) A camera on the lunar base takes pictures of the Earth and saves them in digital format to disk. Suppose Mission Control on Earth wishes to download the most current image, which is 25 MB. What is the minimum amount of time that will elapse between when the request for the data goes out and the transfer is finished?

Soln:

$$T_p = 1.2833333s$$

Image size = 25 MB (Mega bytes not megabits)

$$25\text{MB} * 8 = 200 \text{ Mbits}$$

Now we must find Transmission time

$$T_t = \text{file size} / \text{bandwidth}$$

$$= 200 \text{ Mbits} / 1000000000 \text{ bits/s}$$

$$= 200000000 \text{ bits} / 1000000000 \text{ bits/s}$$

$$= 0.2 \text{ seconds}$$

Now we must find total time

$$\begin{aligned} \text{Total time elapsed} &= \text{RTT} + T_t \\ &= 2.5667s + 0.2s \\ &= 2.7667 \text{ seconds} \end{aligned}$$

4. For the following, assume that no data compression is done. Calculate the bandwidth necessary for transmitting in real time:

(a) High-definition video at a resolution of 1920×1080 , 24 bits/pixel, 30 frames/second.

Soln:

$$\text{Total pixels/frame} = 1920 * 1080 = 2,073,600 \text{ pixels}$$

$$\text{Total bits/frame} = 2,073,600 * 24 = 49,766,400 \text{ bits}$$

$$\text{Total bits/sec} = 49,766,400 * 30 = 1,492,992,000 \text{ bits/sec}$$

$$\text{Therefore, total Bandwidth required} \sim 1,492.992 \text{ Mbps or } 1.492992 \text{ Gbps}$$

(b) POTS (plain old telephone service) voice audio of 8-bit samples at 8 KHz.

$$\text{Bits/sample} = 8$$

$$\text{Sample rate} = 8 \text{ KHz}$$

$$\text{Bits/sec} = 8 \text{ bits/sample} * 8000 \text{ samples/second} = 64,000 \text{ bits/second}$$

$$\text{Bandwidth required} = 64000 \text{ bits/second} = 64 \text{ Kbps}$$

(c) GSM mobile voice audio of 260-bit samples at 50 Hz.

$$\text{Bits/sample} = 260$$

$$\text{Sample rate} = 50 \text{ hz}$$

$$\text{Bits/second} = 260 \text{ bits/sample} * 50 \text{ samples/second} = 13000 \text{ bps}$$

$$\text{Bandwidth required} = 13000 \text{ bits/s} = 13 \text{ Kbps}$$

(d) HDCD high-definition audio of 24-bit samples at 88.2 kHz.

Soln:

$$\text{Bits/sample} = 24$$

$$\text{Sample rate} = 88.2 \text{ KHz}$$

$$88.2 \text{ KHz} = 88200 \text{ samples/second}$$

$$\text{Bits/second} = 24 \text{ bits/sample} * 88200 \text{ samples/second} = 2116800 \text{ bits/second}$$

$$\text{Bandwidth required} = 2116800 \text{ bits/second} = 2.1168 \text{ Mbps}$$
